### Project Demo

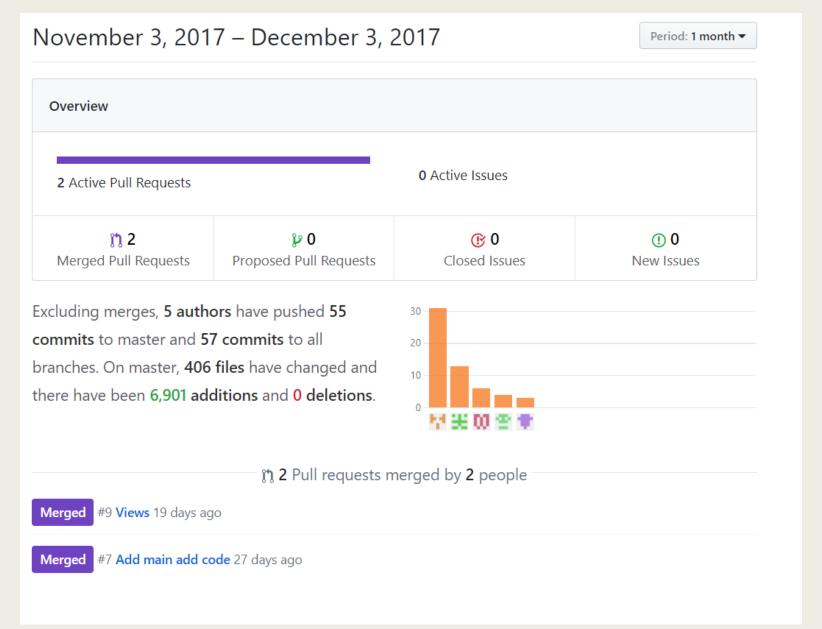

- View events
  - Monthly
  - Daily
  - Agenda
- Add event
  - Single
  - Weekly
  - Monthly
- Edit event
  - Change date
  - Change time
  - Change occurrence
- Delete event

### Commits

97 commits

### Insight

## Team Organization

- Team meetings
  - Meetings occurred after each class for updates
  - Once a month longer meetings pertain to the project
  - Communicated by text or in person
- Task distribution
  - Appointment of task by group discussion and skill level

### Coding Style and Comments

#### Link -

http://www.oracle.com/technetwo rk/java/javase/documentation/co deconvtoc-136057.html

- We tried to stick to the code convention linked above for oracle
- Camel case style
- Comments in code are used on a as needed basis for inside methods
  - Methods should all be commented on for use in Java Docs
  - Statements that need clarification or more guidance
  - Classes should all be commented on for use in Java Docs

```
* Checks for error within the user input such as long comment or title along with missing
 * needed items to add in the event
  Oparam startMinute the start minute must be assigned
 * @param startHour the start hour must be assigned
 * @param endMinute the end minute must be assigned
  @param endHour the end hour must be assigned
  Oparam startDay checking the day is not 0
  @param eventTitle must be checked for for >0 and <64 characters</pre>
  @param eventComments must be checkd for <256 characters</pre>
  Greturn returns true if no errors are found, false is at least one is found
public boolean Noerrors (int startMinute, int startHour, int endMinute, int endHour,
                        int startDay, String eventTitle, String eventComments) {

        StringBuilder errors =new StringBuilder();
        if ( eventComments.length()>256) {errors.append("comment length,");}
                                                                                  //Check comments
        if ( eventTitle.length() == 0 || eventTitle.length()>32) {errors.append
                ("event title length, ");}
                                                                                  //Check blank title
        if ( startMinute == 0 && startHour == 0) {errors.append("start time, ");}//Check start time
        if ( endMinute == 0 && endHour == 0) {errors.append("end time, ");}
                                                                                  //Check end time
        if ( startDay == 0) {errors.append("start Date, ");}
                                                                                  //Check blank date
        Toast.makeText(getBaseContext(), text: " Please correct the error/s " +
                errors, Toast. LENGTH LONG) . show();
                                                                                  //push message
        return false;
    return true;
```

### Design Pattern

#### Adapter Pattern

EventView adapts
 AppCompatActivity to give
 the database a usable
 interface

```
public class EventView extends AppCompatActivity {
    int startY = 0, startM = 0, startD = 0, startH = 0, startMi = 0, endH = 0, endM = 0, returnToView=0;
    String occurrenceId, eventId, extraId, color;
    private int id = 0;
    private int occurrenceCheck = 0;
    EventsDb db = new EventsDb(this);
    Event event = new Event();
     * gets data from intent for results on the edit events button
     * @param requestCode checks code for the correct number 1 or 2
     * @param resultCode checks results for RESULTS_OK or CANCEL_RESULTS
     * @param data all items passed via intent
    public void onActivityResult(int requestCode, int resultCode, Intent data) {
        super.onActivityResult(requestCode, resultCode, data);
        //if(requestCode == 2 && requestCode == RESULT_OK)
        //Toast.makeText(getBaseContext(), startMinute + endMinute + startHour + endHour + startDay + startYear, Toast.LENGTH LONG).show();
        if (requestCode == 2 && resultCode == RESULT_OK) {
            eventId = data.getStringExtra("eventTitle");
            startY = data.getIntExtra("startYear", 0);
            startM = data.getIntExtra("startMonth", 0);
            startD = data.getIntExtra("startDay", 0);
            startH = data.getIntExtra("startHour", 0);
            startMi = data.getIntExtra("startMinute", 0);
            endH = data.getIntExtra("endHour", 0);
            endM = data.getIntExtra("endMinute", 0);
            occurrenceId = data.getStringExtra("occurrence");
            extraId = data.getStringExtra("extraComments");
            color = data.getStringExtra("colorSelected");
            setData(startY, startM, startD, startH, startMi, endH, endM, occurrenceId, eventId,
                    extraId, color);
